

Pixel Art Wedding Dress-up Website

- Flippable cards, floating in screen (connecting to one single photo) with rounded edges for only the 4 corners
- An organized walkthrough style for each category: ideal venue (i.e. themes, color palette), food catering, couple outfit, flower arrangements, guest dress code
- For flower arrangements and couple outfit, there's a dress up option (drag it to character to dress)

CARD FLIP EFFECT

Skills to use

- `<div>` polaroid containers and its corresponding animation css classes like `.colorSwap` and `.colorSwap:hover` for the flipping card of the images
- Finding a pattern or cute bg design to use `background-size: cover` under the html css class
- Organization of boxes inside or images within the screen and positioning them properly

Skills to learn

- Need to learn how to drag items on the screen to another item on the screen
- How to make an item or image stay the way they are even when the user navigates to another screen
- <https://www.youtube.com/watch?v=yefgBA1CecI> (typewriter effect)
 - Not sure if this is possible with just HTML and CSS — need to do some research on it.
